

WebSurv is a powerful platform which serves real-time SCADA information across the entire enterprise. WebSurv makes use of SCADA Replicator, which replicates the SCADA database to a database on a separate server, offloading the SCADA host(s). WebSurv is an instant, out-of-the-box solution providing unparalleled ease of use and service for your information requirements.

WebSurv provides a feature set that makes it a breeze to provide SCADA information across the enterprise:

- User-friendly SCADA Explorer drill-down interface to view configuration and information
- Tabular and Graphical Displays
- Common pre- configured interface for all users, no need to build custom screens
- Automatically retrieves data from alternate master during fail-over condition.
- Password protection

WebSurv leverages your significant investment in Worldview graphics by allowing the users to view the screens in a web browser. This means:

- Access to Worldview screens anywhere you have access to the network, keeping the information in front of the people that need it most
- Worldviews without multiple instances of client software to manage, making a cost effective and user friendly way to manage access to SCADA information.
- System maps are maintained in one location instead of on multiple machines, eliminating the maintenance cost and hassle.

Benefits:

- Provides secure, read only access to SCADA information via a zero-maintenance web browser client.
- Eliminates multiple instances of software to manage
- View Worldview graphics
- Custom reports
